USER GUIDE

Reversing with the motor

For Van Beijck motors with reverse function: handy for tricycles, cargo bikes and other heavy bikes.

With the reverse function the motor drives gently backwards at about 5 to 6 km/h. You need a throttle for this.

How to reverse

1. **Stand still**
   Make sure the bike is standing still.

2. **Display on level 0**
   Set the display to **level 0** with −.

3. **Feet off the pedals**
   Take your feet off the pedals. The pedals may turn backwards while reversing.

4. **Throttle**
   Press the throttle gently: the bike now moves backwards. Release the throttle to stop.

5. **Forward again**
   Set the display back to level 1 or higher. You now ride forwards as normal.

> ⚠ **Always look behind you**
> Check carefully that nobody is behind the bike before reversing. Move slowly and keep both hands on the bike.
